1 Introduction

We are developing a business website for **FinTax**, a financial and accounting company based in Poland. Here's an overview of the planned features and functionalities:

- **Navigation Tabs:**

Our website will include several essential tabs for easy navigation, such as: Home, Services, About Us, Contact,

- **Login Capability:**

We will implement a user-friendly login system to provide clients with personalized access to their accounts and financial data.

- **Responsiveness:**

The website will be fully responsive, ensuring an optimal user experience across various devices, including desktop computers, tablets, and mobile phones.

- **Newsletter Subscription:**

Users will have the option to subscribe to our newsletter to receive updates on financial news, tax changes, and accounting tips.

- **Cookie Management:**

We will incorporate a cookie notification and management system to ensure compliance with data protection regulations. Users will have the choice to accept or decline cookies.

- **Contact Reservation:**

To facilitate easy communication, our website will feature a contact reservation system. This will allow clients to schedule appointments or consultations with our financial experts at their convenience

We look forward to delivering a user-friendly and informative website to assist FinTax in its mission to provide top-notch financial and accounting services in Poland.

2 Aim and scope of the project

The main goal of this project, as well as the entire Internet Technologies course, will be to become familiar with the construction, structure, and op-

eration of the modern Internet. We will acquire this knowledge by creating a website.

An important goal of this course will also be learning to work in groups - this specific type of work is used today in almost every serious company in the technology industry. The cooperation will allow us to understand how important efficient communication in a team is and that there will always be disagreements and a compromise must be worked out. In addition, we will be training skills related to punctuality and keeping deadlines.

Among the main requirements we will set will be the statement that the website must be transparent and easy to use. We will want to find a golden mean between aesthetics and functionality.

3 Schedule

As per the requirements, during the first class, we presented a schedule outlining our tasks and objectives for the upcoming weeks. However, as we progressed with our work, we realized that our initial schedule was inadequate, and the terms mentioned were overly broad. Here is the original version of the schedule:

1. **19.10** - Designing the website mockup, its functionality, the graphic elements, creating the concept of website responsiveness.
2. **26.10** - Hosting and Domain - making analysis SWOT.
3. **02.11** - HTML - Creating the page structure part.
4. **09.11** - CSS - Defining the page's interface.
5. **16.11** - CSS and Grid \Flexbox \Bootstrap - Fine-tuning the page layout - creating website responsiveness.
6. **23.11** - JavaScript - Creating basic scripts.
7. **30.11** - JavaScript - Developing scripts for website interactions.
8. **07.12** - PHP - Implementing scripts connecting to the database, enabling login, and adding Cookies and Newsletter.
9. **14.12** - Implementing databases to allow user login.
10. **21.12** - Final Report.

4 Technologies

In our IT project, we will be delving into the realm of web development, where we'll harness the power of HTML and CSS.

HTML, or HyperText Markup Language, serves as the backbone of web content, enabling us to structure and organize the elements of our web pages. It's essentially the language that browsers understand to render text, images, links, and more.

Complementing HTML is **CSS**, which stands for Cascading Style Sheets. CSS empowers us to define the visual aspects of our web pages, including layout, fonts, colors, and the overall design. It plays a pivotal role in ensuring our website looks visually appealing and is easy to navigate.

As for our approach, we're contemplating whether to employ the flexibility of CSS Grid or harness the pre-built design components of Bootstrap. This decision will be informed by our project's specific requirements and what best aligns with our design objectives.

One interesting aspect of our endeavor is that one of our team members is in the process of acquiring proficiency in these technologies. This project will serve as a valuable learning experience for them, providing hands-on practice and the opportunity to develop real-world skills. It's an exciting journey of growth and exploration as we leverage these technologies to craft a dynamic and user-friendly website.

In our IT project, we will be utilizing a variety of tools and platforms to ensure a comprehensive and efficient workflow.

- **Graphic Design:**

We'll rely on tools like Photoshop, Canva and Figma for crafting the visual elements of our website. These software applications enable us to create and manipulate images, logos, and other graphical assets that will enhance the visual appeal of our project.

- **Coding Environment:**

For writing and editing code, we'll make use of Visual Studio Code. This highly versatile code editor offers a wide range of extensions and features that facilitate coding in HTML, CSS, JavaScript, and more. It will be our primary workspace for coding and debugging.

- **Version Control:**

GitHub will serve as our collaboration and version control platform. It allows us to efficiently share, track changes, and manage project files.

The use of Git and GitHub ensures a smooth and organized development process, enhancing team collaboration.

- **Document Preparation:**

Additionally, for preparing reports in a structured and professional format, we will leverage the platform Overleaf. Overleaf is a online tool for writing documents in LaTeX, a typesetting system commonly used in academia and technical documentation. It will enable us to create comprehensive and well-structured project reports.
